

ABSTRACT OF THE DISCLOSURE

There is disclosed a printer-incorporated electronic still camera that may be switched over between a photography
5 mode, a reproduction mode, a print mode and a setup mode by
operating a mode selection dial. If it is judged by an output
signal from an acceleration sensor that the still camera is in
a stable position when the setup mode is selected, a display
device of the still camera initially displays a print menu that
10 includes a list of setup items relating to the print mode. On
the contrary, if the still camera is judged to be in an unstable
position when the setup mode is selected, a camera menu
including a list of setup items for the photography mode is
initially displayed on the display device.
